Project Title: Onychophora (Velvet Worms)

1. **Project Overview**
    a. My website aims to present information on the velvet worms in an easily digestible format, aiming to inform those unfamiliar with the creature.
2. **Resources**
    a. The original Wikipedia article (https://en.wikipedia.org/wiki/Onychophora) has many references and images available for use. I also plan to illustrate images for use on the website.
3. **Audience**
    a. The immediate audience for this website are my instructors and peers in the Interaction Foundations course. Beyond that, I would like my website to be easily digestible for all ages, as the subject matter could be of interest to many people—ranging from children to older adults—who are curious about nature/animals.
4. **Message**
    a. Velvet worms are little-known, bizarre creatures; as such, I would like to emphasize how the natural world hides fascinating secrets, and possibly inspire site viewers to do their own independent research on obscure animals.
5. **Tone**
    a. I would like the website to be playful, but not overly juvenile, in its presentation. The pages should be interesting to explore, with hidden interactivity that ties back to the site's intended message.
6. **Visual Style**
    a. The visual style of the site should be simple and clear. I would like to emphasize the velvet worms themselves through the repetition of their silhouettes (in various colors, mirroring the range of colors they have in the wild), as well as their habitat through simple plant/earth shapes, textures, and colors. I would also like the pages to have elements that clearly "hide" something and change when hovered over. Some references for the intended style are attached below.

- I would like to use windows and doors (stylized to fit the nature theme) as areas of interactivity within the site.
